

BitDefender Security for ISA SERVERS

Antivirus and Antispyware protection for HTTP and FTP traffic

BitDefender Security for ISA Servers offers antivirus and antispyware protection for web traffic. It provides advanced protection for HTTP and FTP traffic, ensuring that your network is secure from malicious threats. The software is easy to use and has a low administration cost, making it a scalable and integrated solution for your business.

Key benefits:

- Safe internet traffic;
- Increased security based on product's excellent response time;
- Ease of use.

Key features:

- Full integration with the Microsoft ISA Server;
- Scans and filters both HTTP and FTP traffic against viruses and spyware;
- Filter management for flexible scanning and configuration;
- Centralized management software compatibility;
- Intuitive product interface.

BitDefender advanced technologies:

B-HAVE At the core of all BitDefender products is B-HAVE (Behavioral Heuristic Analyzer in Virtual Environments). In addition to traditional signature detection and content-based heuristic methods, B-HAVE implements behavior-based heuristics. By emulating a virtual computer-inside-a-computer where pieces of software are run and checked for potential malicious behavior, B-HAVE virtually eliminates false positives and significantly increases detection rates for new and unknown malware. This proprietary BitDefender technology represents a new security layer that keeps the operating system safe from unknown viruses by detecting malicious pieces of code for which signatures have not yet been released.

BitDefender Advanced Technology

BitDefender's advanced technologies, including B-HAVE, have been recognized by leading certification bodies to provide the most proactive antivirus protection available. The BitDefender Antivirus scan engines are certified by ICSA Labs, Virus Bulletin and Checkmark.
